Abstract—We propose the system that offers only the article that is the relation to topics to the user in this research. When the user wants to read the article that is the relation to topics, the user must click the link to the article. Therefore, it is difficult for the user to read only the article related to topics. Moreover, there is the article that is similar to each other content or article. Therefore, user must read the article that is similar to other article. We propose the algorithm to find similar articles. For the proposed system, we use the feature of reported articles. There is an outline of the entire article at the beginning of reported articles.

I. INTRODUCTION

The web news sites become popular, but the whole image of news is not understood easily because one news has divided into some articles. On the other hand, the newspaper and the television are comprehensible. We think that it is a cause that the web news is not arranged. The portal site (such as Yahoo JAPAN News [1]) is news collection site. If news is a little related to other news, it becomes related news and is made a link to related news. Moreover, the portal site publishes the article on a large number of newspapers and news agencies. Therefore, there are a large number of related contents, but it is difficult to read articles that user actually wants to read. The text mining is effective for this problem [2], [3], [4].

There are some previous work for the summary of the news article [5], [6], [7]. However, it doesn’t go well in the proposal method because the news article on Web is short. There is previous work for web document focusing on topic transition processes [8]. We paid attention to a time connection of the article.

We propose the system that offers only the article that is the relation to topics to the user in this research. When the user wants to read the article that is the relation to topics, the user must click the link to the article. Therefore, it is difficult for the user to read only the article related to topics. Moreover, there is the article that is similar to each other content or article. Therefore, user must read the article that is similar to other article. We propose the algorithm to find similar articles. For the proposed system, we use the feature of reported articles. There is an outline of the entire article at the beginning of reported articles.

II. PROPOSED SYSTEM

This chapter describes a proposed algorithm for low related articles and similar articles are deleted from the list of the news of topics.

The flow of the algorithm is shown below.

1) input top-page URL of topics
2) get the beginning sentence and the delivery date
3) process morphological analysis using MeCab [9]
4) extract keywords
5) extract high relativity articles
6) delete similar articles
7) output results

The user acquires URL of topics that the user wants to learn from the top page of topics of news and the program outputs URLs to the text file. At this time, we think the article only in the image thought that the content is low relativity, then that URL is excluded. Moreover, the link is not acquired when there is a page such as other newspapers because it targets only Yahoo! JAPAN news in this paper.

It accesses acquired URL, and the sentence to the punctuation of the start of the text and the delivery date is acquired.
Because the noun decreases when one sentence of the start is short, the following punctuation is acquired in addition, and it outputs it to the text file for 20 characters or less. Moreover, delivery time of the article is acquired, and it outputs it to the text file with URL of the article. But, for the situation that there is no abstract sentences at the beginning. Then, the some sentences until punctuation are extracted when the first sentence is shorter than the threshold. It sets it to 25 characters as a result of experimenting on the number of strokes that becomes a standard.

The extracted part of speech is sorted to the lexical order, and a large number of consecutive nouns are found. It thinks this noun to be a noun that characterizes the relativity of topics, and only the article with this noun is output to the text file. However, when the same in one article two nouns or more exist, it counts with one. Moreover, the article not extracted is output to another text file. We use of the expression agreement technique to consider the number of extracted words. The following equation is used for the expression agreement technique [10]. In the equation, \( x \) is a number of words of sentences \( X \) that become standards, \( y \) is a number of words of sentences \( Y \) that become the object of comparisons, and \( m \) is a number of words that appears in both \( X \) and \( Y \). It experimented to set the evaluation value as well as algorithm 1. As a result, if \( \text{Score}(X, Y) \) is larger than 60%, it is judged that two articles are similar, and deletes an old article.

\[
\text{Score}(X, Y) = \frac{m}{x} + \frac{m}{y} \times 100
\] (1)

We think that it is rare that same topics exist in two days or more. It is based on the newest article in the extracted relativity and high article, the nouns on the day before article are compared. If the noun more than the evaluation value of nouns that exist in the article that became a standard exists in the article on the object of comparison, it is judged that two articles are similar and deletes an old article.

As an output result, the extracted URLs are written to the html file with the title of the article, newspaper site name in delivery origin, delivery date, extracted nouns and opening sentences. Moreover, URL of low relativity articles and similar articles are output to the text file respectively. (See Fig. 1)

**III. Conclusion**

It is thought that the extraction result in which accuracy is high can be generated by considering the shake of the synonym and the mark of the morpheme not considered in the algorithm of this system, and the appearance order. We think about the use of the parsing tool [11]. Because a relativity judgment is an algorithm that one noun extracted of the deletion only by not existing at the beginning in the sentence, the number of nouns that become standards of the comparison is increased.

It is thought that the false detection that deletes a relativity and high article can be eliminated by assuming the algorithm considered that relativity is high if there is those nouns. Moreover, at similar articles detection, articles are compared after the noun of high frequent occurrence is excluded, and there is a possibility the keywords can be extracted.
