Summary: The generation of leukotrienes B4 (LTB4) and C4 (LTC4) by leucocytes stimulated with Ca ionophore A23187 was examined in 71 patients with asthma (42 with atopic and 29 with nonatopic asthma) and 23 healthy controls. Of these patients, 22 had SDIA (steroid-dependent intractable asthma). 1. The generation of LTB4 and LTC4 by leucocytes was significantly more enhanced in patients with atopic, non-SOIA asthma than in healthy subjects, but not in patients with nonatopic asthma. The generation of LTB4 and LTC4 in atopic asthma was significantly more decreased in patients with SOIA than in those with non-SOIA. 2. The LTC4 generation was significantly larger in attack stage than in attack-free stage of patients with atopic and nonatopic asthma when they had not SDIA. However, no significant difference was found in LTB4 generation between attack and nonattack stages in these patients. 3. In patients with SOIA, no significant differences were observed in the generation of LTB4 and LTC4 between attack and nonattack stages. The results suggest that IgE-mediated allergy and asthma attacks enhance and glucocorticoids inhibit the generation of LTB4 and LTC4 by leucocytes.

key words: bronchial asthma, LTB4, LTC4, IgE-mediated allergy, glucocorticoids

Introduction

Leukotrienes are potent pro-inflammatory mediators contributing to pathophysiological changes of the airways in asthma. Cysteinyl leukotrienes (cysLTs) display bronchoconstrictory effects, increase mucus formation and bronchial wall edema. The cysLTs are mainly generated by eosinophils in the late asthmatic reaction. The amount of cysLTs produced is related to the eosinophil activation state. Leukotriene B4 (LTB4) stimulates neutrophil chemotaxis and activation of the cells, leading to the release of...

mediators, enzymes, and superoxides. LT4 selectively increases the number and percentage of neutrophils in the human lung. It has been shown that neutrophil inflammation enhances bronchial hyperresponsiveness. LT4 is mainly generated by neutrophils. Preincubation of human neutrophils with granulocyte/macrophage-stimulating factor (GM-CSF) results in a modest increase in LTB4 production in response to the chemotactic peptide.

In the present study, generation of LTC4 and LTB4 by peripheral leucocytes stimulated with Ca ionophore A23187 was examined in patients with asthma in relation to IgE-mediated allergy and glucocorticoid therapy.

Subjects and Methods

The subjects of this study was 71 patients (43 females and 28 males) with asthma and 23 healthy subjects (12 females and 11 males, mean age 54.3 years). The mean age of patients with asthma was 61.5 years (range 27-74 years) and mean level of serum IgE was 461 IU/ml (range 2-5195 IU/ml). Asthma was diagnosed according to the criteria of the American Thoracic Society (ATS). Among all subjects with asthma, 42 were atopic, as shown by a positive RAST score for inhalant allergens, and 29 were nonatopic, whose mean serum IgE level was under 250 IU/ml and RAST score for inhalant allergens was all negative. Twelve of 42 patients with atopic asthma and 10 of 29 with nonatopic asthma had steroid-dependent intractable asthma (SDIA).

The generation of leukotrienes, LTC4 and LTB4, by peripheral leucocytes was assessed by a method previously reported. Buffy coat was separated by adding a quarter volume of 6% dextran and followed by being left 1 hour at room temperature. After the number of the cells was adjusted to $5 \times 10^6$/ml in Tris ACM, Ca ionophore A23187 (1 µg) was added to the cell suspension. The mixed solution was incubated for 15 min at 37°C, and centrifuged at 3000 rpm for 30 min after the addition of 4 times volume of pre-chilled ethanol (finally 80% ethanol). Supernatant was taken into the syringe filter (Toyo Roshi Co, Japan), and the filtrate was decompressed and dried up to solid. The solid was dissolved with 250 µl of 50% ethanol. The HPLC analysis for LTB4 and LTC4 was performed by a method described by Lam, et al. The results were expressed as ng/5 X 10^6 cells.

IgE antibodies against inhalant allergens, house dust mite, cockroach and Candida albicans, were estimated by radioallergosorbent test (RAST), and serum level of total IgE was measured by radioimmunosorbent test (RIST).

Statistically significant differences of the mean were estimated using the unpaired Student's t test. A p value of <0.05 was regarded as significant.

Results

Table 1 shows the characteristics of patients with atopic and nonatopic asthma. The number of patients with positive RAST score for inhalant allergens was significantly larger in patients with atopic asthma than in those with nonatopic asthma. The mean of serum IgE was significantly higher in atopic asthma than in nonatopic. The generation of LTB4 by leucocytes stimulated with Ca ionophore A23187 was significantly higher in patients with atopic, non-SDIA (87.1 ± 43.9 ng/5 X 10^6 cells) (mean ± SD) compared to the generation in healthy subjects (43.1 ± 
24.2 ng/5 x 10^6 cells) (p<0.001). A significant difference was found in LTB4 generation between atopic subjects with SDIA and non-SDIA. However, there was no significant difference in LTB4 generation between patients with nonatopic asthma and healthy controls (Fig. 1).

The generation of LTC4 by leucocytes was significantly larger in patients with atopic, non-SDIA (79.3±27.0 ng/5 x 10^6 cells) than in healthy subjects (5.1±5.2 ng/5 x 10^6 cells) (p<0.001). The LTC4 generation in patients with atopic, non-SDIA was significantly higher in patients with atopic, SDIA (p<0.001), and in those with nonatopic, non-SDIA (p<0.001) and SDIA (p<0.001) (Fig. 2).

The generation of LTB4 and LTC4 by leucocytes was generally low in patients with SDIA, and there were no significant differences in the generation of LTB4 and LTC4 by leucocytes of these patients between attack and attack-free stages (Fig. 3,4). The generation of LTB4 and LTC4 by leucocytes of patients with non-SDIA was generally higher compared to the generation in those with SDIA. The LTC4 generation was significantly higher in attack stages than in attack-free stages of both atopic (p<0.02) (Fig. 5) and nonatopic asthma (p<0.05) (Fig. 6). However, no significant difference was present in the LTB4 generation between attack and attack-free stages.

Discussion

Asthma is characterized by inflammatory changes of the airways, in which inflammatory cells such as lymphocytes, neutrophils and eosinophils, and a number of cytokines including leukotrienes released from these cells participate in the late asthmatic reaction. Among inflammatory cells, activated T lymphocytes and eosinophils play an important role in induction and persistence of the reaction.

Leukotriene B4 and cysLTS, LTC4, LTD4 and LTE4, play an important role in pathophysiology of the airways of bronchial asthma. A number of factors can influence LTB4 production as well as cysLTS. LTB4 has a chemotactic action for neutrophils as well as interleukin 8 (IL8), which causes bronchial hyperresponsiveness and airway neutrophil accumulation.

LTC4 production is almost exclusively due to eosinophils. Eosinophils appear to be important in asthma pathophysiology. Accumulation of the cells into the airways often associated with increased production of LTC4. The amount of LTC4 production by eosinophils depends not only on the number of the cells but also on the degree of activation. When antigen was challenged into the airways, the concentration of LTC4 increased strongly correlated with the number of eosinophils migrated into the airways, suggesting that antigen causes recruitment and activation of the cells.

In the present study, the generation of LTB4 and LTC4 by leukocytes stimulated with Ca ionophore A23187 was examined in patients with asthma in relation to IgE-mediated allergy and glucocorticoid therapy. It has been shown that stimulation with ionophore A23187 induced a significantly higher leukotriene C4 generation from granulocytes of asthmatic children than from granulocytes of healthy controls. They also demonstrated that granulocytes from patients with a history of severe asthma displayed a higher LTC4 formation than granulocytes from patients with less severe disease.

Our results also showed that the LTB4 and LTC4 generation was significantly larger in patients with atopic, non-SDIA than in healthy controls. However, the generation of LTB4 and LTC4 was not significantly more increased in patients with nonatopic asthma than in healthy subjects. In atopic asthma, the LTB4 and LTC4 generation were significantly more suppressed in patients with SDIA than in those with non-SDIA. The results suggest that the generation of LTB4 and LTC4 by leukocytes is influenced by IgE-mediated allergy and glucocorticoid reg-
IgE-mediated allergy and LTC4

IgE-mediated allergy and LTC4

imen. Furthermore, the generation of LTC4 by leucocytes was significantly higher in attack stage than in attack-free stage in patients with non-SDIA. The results are consistent with the data showing enhanced production of LTC4 by activated eosinophils during antigen challenge. Regarding asthma type, the generation of LTC4 by leucocytes was significantly larger in atopic asthma compared to the generation in nonatopic disease in both attack and attack-free stages. An important role of interleukin 5 (IL-5) in IgE-mediated allergic reactions has been shown by several investigators. Parallel patterns of increase of IL-5 and eosinophils imply the possibility of a bidirectional interaction between them. These results may suggest a possibility that LTC4 generation is more closely related to IgE-mediated reaction than to other reaction, and influenced by glucocorticoid regimen.

気管支喘息71例および健康人23名を対象に、Ca ionophore A23187 刺激時の末梢血白血球のロイコトリエンB4（LTB4）およびC4（LTC4）の産生能について検討を加えた。なお、71例中ステロイド依存性重症難治性喘息（SDIA）は22例であった。1. アトピー性、非SDIA症例におけるLTB4、LTC4産生は、健康人と比べ有意に高い値を示したが、非アトピー性喘息では健康人との間に有意の差は見られなかった。また、アトピー性喘息では、SDIA症例において非SDIA症例に比べ、LTB4、LTC4産生が有意に抑制されていた。
2. 非SDIA症例では、アトピー性、非アトピー性を問わず、LTC4産生は、非発作時に比べ発作時に有意に亢進した状態であった。しかし、LTB4産生には、発作時、発作時との間に有意の差は見られなかった。
3. SDIA症例では、LTB4、LTC4産生と発作との有意の関連は見られなかった。

以上の結果より、IgEにmediateされるアレルギー反応や喘息発作はLTB4、LTC4産生に促進的に、また副腎皮質ホルモンは抑制的に作用することが示唆された。
