ON ADDITIVE FUNCTIONALS OF MEASURABLE FUNCTION SPACES

SHOZO KOSHI

1. Introduction

Let \( \Omega \) be a measure space with finite measure \( \mu \). Recently, N. Friedman and M. Katz (1) discussed the representation of the additive functionals on function space \( L_p(\Omega) \) (\( p>0 \)) and showed that every additive functional \( \Phi \) on \( L_p \) satisfying the continuity condition can be represented by the kernel function \( K(h, \omega) \) as follows:

\[
\Phi(f) = \int K(f(\omega), \omega) \, d\mu \quad \text{for } f \in L_p.
\]

In this paper, we discuss the representation theorems of additive functionals of more general measurable function space \( L_p \) and the structure of \( K(h, \omega) \) will be deeply related to the function space \( L_p \), provided that the measure space \( \Omega \) is non-atomic with respect to \( \mu \). In fact, in the case \( L_p = L_p(\mu)(p>0) \), we have found that \( \Phi(f) = \int K(f(\omega), \omega) \, d\mu(\omega) \) is an additive functional of \( L_p(\mu) \) iff \( |K(h, \omega)| \leq a(\omega) + A|h|^p \) for a.e. \( \omega \in \Omega \) and every real number \( h \), where \( A \) is a positive number and \( 0 \leq a(\omega) \in L_1(\mu) \).

The proofs of theorems in this paper owe to the idea of the Shimogaki's paper (2), even if his method is related to the theory of vector lattice. In this paper, we discuss only by measure theoretic method.

2. Function spaces \( L_p \)

Let \( \Omega \) be a non-atomic measure space with finite measure \( \mu \) and let \( \rho(h, \omega) \) be a function of two variables \( h \in (-\infty, \infty) \) and \( \omega \in \Omega \), satisfying the following conditions:

\[
\begin{align*}
(\rho. 1) \quad & + \infty \geq \rho(h, \omega) = \rho(-h, \omega) \geq 0, \quad \rho(0, \omega) = 0 \quad \text{for a.e. } \omega \in \Omega. \\
(\rho. 2) \quad & \rho(h, \omega) \text{ is a measurable function of } \omega \text{ for a fixed } h \in (-\infty, \infty). \\
(\rho. 3) \quad & \rho(h, \omega) \text{ is a left-hand continuous function of } h \geq 0 \text{ for a.e. } \omega \in \Omega. \\
(\rho. 4) \quad & \rho(h, \omega) \geq \rho(h_0, \omega) \quad \text{for } |h_1| \geq |h_2|.
\end{align*}
\]

We shall define a measurable function space \( L_p \) as follows:

\[
L_p = \{ f ; \mu\text{-measurable and } \rho(f) = \int \rho(f(\omega), \omega) \, d\mu(\omega) < +\infty \}.
\]

We see easily:
(1) \(|f_1| \geq |f_2|\) implies \(\rho(f_1) \geq \rho(f_2)\);

(2) if \(L_o \subseteq f\), \(|f| \geq |g|\) and \(g\) is measurable, then \(g \in L_o\);

(3) \(L_o\) is a convex set and \(f, g \in L_o\) implies \(f + g \in L_o\);

(4) \(L_o\) is a lattice by the usual lattice operation;

(5) \(0 \leq f_i \uparrow f\) and \(f_i, f \in L_o(i = 1, 2, \cdots)\) imply \(\rho(f) = \sup_i \rho(f_i)\);

(6) if \(f_i(i = 1, 2, \cdots)\) are measurable and mutually orthogonal, then

\[
\rho\left(\sum_{i=1}^\infty f_i\right) = \sum_{i=1}^\infty \rho(f_i).
\]

In the following, if necessary, a function \(f \in L_o\) is identified with a function \(g \in L_o\) which is equal to \(f\) except measure zero set. We shall state here the generalized Lebesque theorem which is need in the proof of Theorem 7.

Let \(0 \leq f_\lambda \in L_o\) be a directed system with \(\sup \rho(f_\lambda) < + \infty\), then \(\sup \rho(f_\lambda)\) exists and \(\rho(f) = \sup \rho(f_\lambda)\).

3. Additive functionals

A functional \(\Phi\) on \(L_o\) is called an additive functional on \(L_o\) if

i) \(|\Phi(f)| < + \infty\) for all \(f \in L_o\);

ii) \(\Phi(f + g) = \Phi(f) + \Phi(g)\) for \(f, g \in L_o\) with \(|f| \cap |g| = 0\).

By definition of additive functionals, we find the following properties of \(\Phi\):

(1) \(\Phi(0) = 0\)

(2) \(\Phi(|f|) = \Phi(f^+) + \Phi(f^-)\) for \(f \in L_o\), where \(|f| = f^+ + f^-\), \(f^+ = f \cup 0\), \(f^- = (-f) \cup 0\).

If \(\Phi\) satisfies

(3) \(\Phi(-f) = -\Phi(f)\),

then \(\Phi\) is called an odd additive functional.

Since \(L_o\) is not a linear space in general, it is not necessary that \(f \in L_o\) implies \(\alpha f \in L_o\) for all real number \(\alpha\).

Now, we shall consider the continuity conditions of additive functionals.

(CI) For mutually orthogonal functions \(f_n \in L_o(n = 1, 2, \cdots)\) with \(\sum_{n=1}^\infty f_n \in L_o\), it yields \(\Phi(\sum_{n=1}^\infty f_n) = \sum_{n=1}^\infty \Phi(f_n)\) (i.e. absolutely convergent).

(CII) \(0 \leq \alpha_1 \alpha\) and \(\alpha f \in L_o\) implies \(\Phi(\alpha f) \rightarrow \Phi(\alpha f)\).

For an additive functional \(\Phi\) on \(L_o\), we can define a new additive functional such that

http://escholarship.lib.okayama-u.ac.jp/mjou/vol13/iss2/5
ON ADDITIVE FUNCTIONALS

\[ |\psi| (f) = \sup_{g \in F(f)} |\psi(g)|. \]

Clearly \(|\psi|\) satisfies the following conditions:

(i) \(|\psi| (0) = 0\)

(ii) \(|\psi| (f) \geq 0\) for all \(f \in L_p\).

(iii) \(|\psi| (f + g) = |\psi| (f) + |\psi| (g)\) for \(|f| \cap |g| = 0\).

(iv) \(|\psi| (f) = |\psi| (|f|)\).

(v) \(|f| \leq |g|\) implies \(|\psi| (f) \leq |\psi| (g)\).

It may happen that \(|\psi| (f) = + \infty\) for some \(f \in L_p\). If \(\psi\) satisfies that \(|\psi| (f) < \infty\) for all \(f \in L_p\), then \(\psi\) is called a type of bounded variation.

**Theorem 1.** If an additive functional \(\psi\) satisfies (CI), then \(\psi\) is a type of bounded variation.

**Proof.** Suppose that \(|\psi| (f) = + \infty\) for some \(f \in L_p\). Since the measure space \(\Omega\) is non-atomic, we find a sequence of measurable sets \(\Omega \supseteq \Omega_1 \supseteq \Omega_2 \supseteq \cdots\) such that \(\mu (\Omega_n) \to 0\) and \(|\psi| (f \cdot \chi_{\Omega_n}) = + \infty\) for \(n = 1, 2, \cdots\), where \(\chi_{\Omega_n}\) is a characteristic function on a measurable set \(\Omega_n\).

Since \(\psi\) satisfies (CI) and \(\mu (\Omega_n) \to 0\), we find that \(\psi (g \chi_{\Omega_n}) \to 0\) for all \(g \in L_p\).

By induction, if we define a function \(f_n \in L_p\) with \(|f_n| \leq |f|, f_n = f_n \cdot \chi_{\Omega_n}\), and \(|\psi| (f_n) > n\), then we can find a number \(i_{n+1}\) such that \(g_n = f_n - f_n \chi_{\Omega_{i_{n+1}}} \) and \(|\psi| (g_n) > n/2\), since \(\psi (g \chi_{\Omega_n}) \to 0\) for all \(g \in L_p\) by (CI). Hence we find a function \(f_{n+1} = f_{n+1} \chi_{\Omega_{i_{n+1}}}\) with \(|\psi| (f_{n+1}) > n + 1\) and \(|f_{n+1}| \leq |f|\) because of \(|\psi| (f \chi_{\Omega_n}) = + \infty\).

By the considerations above, for all natural numbers \(n \geq 1\), we find a function \(g_n = f_n - f_n \chi_{\Omega_{i_{n+1}}}\) with \(|g_n| \leq |f|\) and \(|\psi| (g_n) > n/2\). Clearly the sequence of functions \(\{g_n\}\) is mutually orthogonal. Since \(|\sum_{n=1}^{\infty} g_n| \leq |f|\), we have \(\sum_{n=1}^{\infty} g_n \in L_p\).

But \(\psi (\sum_{n=1}^{\infty} g_n) = \sum_{n=1}^{\infty} \psi (g_n)\) is not convergent. This is a contradiction.

**Theorem 2.** If \(\psi\) satisfies (CI), then \(|\psi|\) is also an additive functional satisfying (CI).

**Proof.** Let \(\{f_i\}\) be a sequence of orthogonal functions with \(\sum_{i=1}^{\infty} f_i = f \in L_p\).

For every \(\varepsilon > 0\), there exists \(|g_i| \leq |f|\) with \(||\psi| (f) - |\psi| (g_i)| | \leq \varepsilon\). Let \(e_i = \{x; f_i (x) \neq 0\}\). By (CI), we have \(\psi (g_i) = \sum_{i=1}^{\infty} \psi (g_i \chi_{\Omega_i})\). Hence, \(|\psi| (g_i)| = \sum_{i=1}^{\infty} |\psi (g_i \chi_{\Omega_i})| \leq \sum_{i=1}^{\infty} |\psi| (f_i) \leq |\psi| (f)\) i.e. \(\sum_{i=1}^{\infty} |\psi| (f_i) = |\psi| (f)\) Since

Produced by The Berkeley Electronic Press, 1967
\[ \varepsilon \text{ is arbitrary, we see } |\Phi|(f) = \sum_{i=1}^{n} |\Phi|(f_i). \]

**Theorem 3.** If \( \Phi \) satisfies (CII), then \( |\Phi| \) is an additive functional satisfying (CII).

Proof. By theorem 1, we have \( |\Phi|(f) \leq +\infty \) for all \( f \in L_\nu \). Let \( 0 \leq \alpha_i \uparrow \alpha \) and \( \alpha f \in L_\nu \). For any positive number \( \varepsilon > 0 \), there exists \( f_\varepsilon \) such that \( |f_\varepsilon| \leq |\alpha f| \) and \( ||\Phi|(\alpha f) - |\Phi|(f_\varepsilon)| | \leq \varepsilon \). Since \( \frac{\alpha_i}{\alpha} \to 1 \), \( |\Phi(\frac{\alpha_i}{\alpha} f_i) - \Phi(f_\varepsilon)| \leq \varepsilon \) for large \( i \).

\[
0 \leq |\Phi|(\alpha f) - |\Phi|(\alpha_i f_i)
\leq |\Phi|(\alpha f) - |\Phi|(\frac{\alpha_i}{\alpha} f_i)
\leq |\Phi|(\alpha f) - |\Phi|(\frac{\alpha_i}{\alpha} f_i)
= |\Phi|(\alpha f) - |\Phi| f_\varepsilon + |\Phi| f_\varepsilon - |\Phi|(\frac{\alpha_i}{\alpha} f_i)
< 2\varepsilon.
\]

Hence, we have
\[ |\Phi|(\alpha f) = \lim_{\alpha \to \infty} |\Phi|(\alpha_i f_i). \]

We shall consider another condition of continuity.

(CIII) \( 0 \leq f_i \uparrow f \) or \( 0 \geq f_i \downarrow f \) with \( f \in L_\nu \) imply \( \Phi(f_i) \to \Phi(f) \).

Clearly, (CIII) implies (CI) and (CII).

**Theorem 4.** If \( \Phi \) satisfies (CI) and (CII), then \( |\Phi| \) satisfies (CIII).

Proof. Let \( 0 \leq f_i \uparrow f \in L_\nu \). For any \( 1 > \varepsilon > 0 \), we shall consider the function
\[ (f_i - (1-\varepsilon)f) \cup 0 = g_i. \]

For the set \( e_i = \{ x : g_i(x) > 0 \} \), we have \( e_i \subseteq e_{i+1} \subseteq \cdots \) and \( \lim_{i \to +\infty} e_i = e = \{ x : f(x) > 0 \} \).

Since \( (1-\varepsilon)f \cdot \chi_{e_i} \subseteq f \cdot \chi_{e_i} \uparrow f \), we have
\[ |\Phi|((1-\varepsilon)f \cdot \chi_{e_i}) \leq |\Phi|(f \cdot \chi_{e_i}) \leq |\Phi|(f) \leq |\Phi|(f). \]

and so,
\[ |\Phi|((1-\varepsilon)f) \leq \sup_i |\Phi|(f_i) \leq |\Phi|(f). \]

Since \( \varepsilon \) is arbitrary positive number, we see
\[ \sup_i |\Phi|(f_i) = |\Phi|(f). \]

In the proof just above, we use the monotone property:
\[ |f| \leq |g| \text{ implies } |\Phi|(f) \leq |\Phi|(g). \]
Hence, for arbitrary monotone additive functional $\phi$, (i.e. $|f| \leq |g|$ implies $\phi(f) \leq \phi(g)$), we have

**Theorem 5.** If $\phi$ is monotone and $\phi$ satisfies (CI) and (CII), then $\phi$ satisfies (CIII).

**Remark.** There exists an additive functional which satisfies (CI) and (CII) and is not monotone, but does not satisfy (CIII).

We shall show such example.

Let $\rho(h, t) = h$ for all $-\infty < h < \infty$, $0 < t < 1$ and let $\mu$ be usual Lebesgue measure on $(0, 1)$ then $L_\rho = L_2(0, 1)$.

For $f \in L_2(0, 1)$, we put $e_\lambda = \{x : f(x) = \lambda x\}$, then $e_{\lambda, \lambda'} = e_\lambda \cap e_{\lambda'}$ is a measure 0 set for $\lambda \neq \lambda'$. Hence, $e_\lambda$ which has positive measure, is at most countable. We denote $e_f$ by the union of such measurable sets. We shall consider an additive functional $\gamma$ defined by $\gamma(f) = \int_{\theta_{(0,1)-e_f}} f d\mu$.

Then, $\gamma$ satisfies (CI) and (CII), but not (CIII).

**Theorem 6.** Let $\phi$ be an additive functional on $L_\rho$ which satisfies (CI). Then there exist positive numbers $\varepsilon, \delta > 0$ such that $\rho(f) \leq \varepsilon$ implies $|\phi(f)| \leq \delta$.

**Proof.** By Theorem 2, $|\phi|$ satisfies (CI) if $\phi$ satisfies (CI).

Since $|\phi|(f) \geq |\phi(f)|$ for every $f \in L_\rho$, we shall prove that there exist $\varepsilon, \delta > 0$ such that $\rho(f) \leq \varepsilon$ implies $|\phi|(f) \leq \delta$. If there exists no such positive number, then we can find an positive measurable function $0 \leq f_n \in L_\rho$ such that

$$\rho(f_n) \leq \frac{1}{2^n} \text{ and } |\phi|(f_n) \geq n \text{ for every } n = 1, 2, \ldots.$$ 

$$\rho(f_1 \cup \cdots \cup f_n) \leq \rho(f_1) + \rho(f_2) + \cdots + \rho(f_n) \leq 1$$

and the sequence of functions $f_n = f_1 \cup f_2 \cup \cdots \cup f_n$ is a monotone increasing system with $\rho(g_n) \leq 1$.

Hence, there exists $f = \bigcup_{n=1}^{\infty} f_n \in L_\rho$.

Since $|\phi|(f) \geq |\phi|(f_n) \geq n$ for all $n = 1, 2, \ldots$, we have $|\phi|(f) = +\infty$.

**4. Representation of additive functionals**

Let $\phi$ be an additive functional on $L_\rho$. We shall assume here that $\phi$ satisfies (CIII). Let $e$ be a characteristic function on $e$ ($\mu$-measurable subset of $\Omega$). For every positive number $h \geq 0$, $\phi(h\epsilon) = m(\epsilon)$, (provided that $h\epsilon \in L_\rho$) is a measure of bounded variation on the measure space $e$ (There exists a maximal measurable set $e_n$ so that $\phi(h\epsilon_n) = +\infty$) $m(\epsilon)$ is absolutely continuous with respect to $\mu$. Hence, by Radon-Nikodym's theorem, we find an integrable function $K(h, \omega)$ such that
for all measurable subset $e$ of $e_h$.

For $\omega \in \Omega - e_h$, we define $K(h, \omega) = \infty$. We see also that $\rho(h, \omega) = \infty$ a.e. $\omega \in \Omega - e_h$. Let $\{h_i\}$ be a system of whole positive rational numbers. For every $h > 0$, we can choose $h_i$ with $h_i \uparrow h$. Since $\int |K(h_i, \omega)|d\mu \leq |\phi(h_i, \lambda e)| \leq |\phi(h, \lambda e)|$ for all measurable set $e \subset e_h$, applying Radon-Nykodym's theorem to $|\phi(h, \lambda e)|$, we see that $|K(h_i, \omega)|$ is bounded by integrable function.

By virtue of Lebesgue majorant theorem and (CIII), we have

$$\lim_{i \to \infty} K(h_i, \omega) = K(h, \omega) \text{ a.e. } \omega \in \Omega.$$

For every negative $h < 0$, we find also $K(h, \omega)$ such that $h_i \downarrow h$ implies $K(h_i, \omega) \to K(h, \omega)$ a.e. $\omega \in \Omega$.

We define $K(h, \omega)$ as (5).

The function $K(h, \omega)$ of two variables $h, \omega$ is measurable with respect to $\omega$ for fixed $h$, and left-hand continuous with respect to $h$ for a fixed $\omega$ (a.e. $\omega$ of $\Omega$), if $h > 0$ and $K(h, \omega)$ is finite. By (CIII) and additivity of $\phi$, using Lebesgue majorant theorem, we have

$$\phi(f) = \int_{\Omega} K(f(\omega), \omega)d\mu = \lim_{t \to \infty} \int_{\Omega} K(f_i(\omega), \omega)d\mu(\omega)$$

for $0 \leq f_i \leq f \leq L_\omega$, where $f_i$ is a step function for $i = 1, 2, \ldots$. For $L_\omega, \exists f \leq 0$, where $f_i \downarrow f(f_i$ is a step function for $i = 1, 2, \ldots$), we have

$$\phi(f) = \int_{\Omega} K(f(\omega), \omega)d\mu = \lim_{i \to \infty} \int_{\Omega} K(f_i(\omega), \omega)d\mu.$$

For arbitrary $f \in L_\omega$, we decompose $f$ into $f = f^+ - f^-$ with $f^+, f^- \in L_\omega$, $f^+ \cap f^- = 0$.

$$\phi(f) = \phi(f^+) + \phi(-f^-) = \int_{\Omega} K(f^+(\omega), \omega)d\mu - \int_{\Omega} K(-f^-(\omega), \omega)d\mu.$$

Hence we have the following theorem:

**Theorem 7.** Let $\phi$ be an additive functional on $L_\omega$, and satisfy (CIII). Then we find a kernel function $K(h, \omega)$ which satisfies:

1. measurable with respect to $\omega \in \Omega$ for a fixed $h$.
2. $0 \leq h_i \downarrow h$ or $0 \geq h_i \uparrow h$, then $K(h_i, \omega) \to K(h, \omega)$ a.e. $\omega \in \Omega$ (provided that $K(h, \omega)$ is finite) such that

$$\phi(f) = \int_{\Omega} K(f(\omega), \omega)d\mu$$

for $f \in L_\omega$

where $|K(h, \omega)| < +\infty$ if $\rho(h, \omega) < +\infty$. 

http://escholarship.lib.okayama-u.ac.jp/mjou/vol13/iss2/5
Remark. If $\varphi$ is odd, then the kernel function $K(h, \omega)$ is an odd function with respect to $h$ (i.e. $K(h, \omega) = -K(-h, \omega)$) for a.e. $\omega \in \Omega$.

Theorem 8. There exists a positive number $A > 0$ and $0 \leq s(\omega) \in L_1(\mu)$ such that

\[ |K(h, \omega)| \leq s(\omega) + A \rho(h, \omega). \]

Proof. We define a functional $T$ on $L_\rho$ as follows:

\[ T(f) = \int \{ |K(f(\omega), \omega)| - A \rho(f(\omega), \omega) \} d\mu \]

where $A > \delta/\varepsilon(\delta, \varepsilon)$ are the positive numbers determined by Theorem 6.) We shall show that $T(f(\omega), \omega) \geq 0$ a.e. $\omega \in \Omega$ implies $\rho(f) < \varepsilon$, where $T(h, \omega) = |K(h, \omega)| - A \rho(h, \omega)$.

If not, there exists $f(\omega) \in L_\rho$ such that $T(f(\omega), \omega) \geq 0$ for a.e. $\omega \in \Omega$ and $\int \rho(f(\omega), \omega) d\mu > \varepsilon$.

Since $\Omega$ is non-atomic, we can find a measurable set $e$ with $\int \rho(f(\omega), \omega) d\mu = \rho(f \cdot \mathcal{X} e) = \varepsilon$. Clearly $T(f \cdot \mathcal{X} e(\omega), \omega) \geq 0$ a.e. $\omega \in \Omega$. By theorem 6,

\[ \delta \geq |\varphi| \int |f \cdot \mathcal{X} e| d\mu \geq \int |K(f \cdot \mathcal{X} e(\omega), \omega)| d\mu \]

\[ = \int T(f \cdot \mathcal{X} e(\omega), \omega) d\mu + A \int \rho(f \cdot \mathcal{X} e(\omega), \omega) d\mu \]

\[ = \int T(f \cdot \mathcal{X} e(\omega), \omega) d\mu + A \rho(f \cdot \mathcal{X} e(\omega)) \]

\[ \geq A \rho(f \cdot \mathcal{X} e) \geq \frac{\delta}{\varepsilon} \cdot \varepsilon = \delta. \]

This is a contradiction.

The system of measurable functions $f(\omega) \in L_\rho$ with $T(f(\omega), \omega) \geq 0$ a.e. $\omega \in \Omega$ is a directed system. In fact, $T(f_1(\omega), \omega) \geq 0$ and $T(f_2(\omega), \omega) \geq 0$ a.e. $\omega \in \Omega$, then

\[ T(f_1 \cup f_2(\omega), \omega) = \begin{cases} T(f_1(\omega), \omega) \geq 0 & \text{for } \omega \text{ with } f_1(\omega) \geq f_2(\omega); \\ T(f_2(\omega), \omega) \geq 0 & \text{for } \omega \text{ with } f_2(\omega) \geq f_1(\omega). \end{cases} \]

By generalized Lebesgue theorem, we find a measurable function

\[ s(\omega) = \text{ess-sup}_{T(f(\omega), \omega) \geq \delta} f(\omega) \in L^1(\mu). \]

Hence, we have

\[ |K(f(\omega), \omega)| \leq s(\omega) + A \rho(f(\omega), \omega) \text{ for a.e. } \omega \in \Omega. \]

Considering $f(\omega) = h \cdot \mathcal{X} e(\omega)$ for arbitrary measurable set $e \in \Omega$, we have
We see easily,

**Theorem 9.** If $K(h, \omega)$ satisfies the conditions (1), (2) of Theorem 7 and (3) of Theorem 8, then

$$
\phi(f) = \int_\Omega K(f(\omega), \omega) d\mu \quad \text{for} \quad f \in L_p.
$$

is an additive functional which satisfies (CIII).

By the method used in the proof of Theorem 8, we find that:

**Theorem 10.** If $\phi$ satisfies (CI), then we find positive numbers $A, B$ such that

$$
|\phi(f)| \leq B + A_p(f) \quad \text{for} \quad f \in L_p.
$$

5. **Supplementary results**

In some cases, we must consider linear spaces. If we consider $\tilde{L}_\rho$: the totality of $\mu$-measurable functions with $\rho(\alpha f) < +\infty$ for some $\alpha \neq 0$, then $\tilde{L}_\rho$ is a linear space.

In the following, we shall consider an additive functional $\phi$ on $\tilde{L}_\rho$.

At first, we have

**Theorem 11.** $L_\rho = \tilde{L}_\rho$ (i.e. $L_\rho$ is a linear space) if and only if there exist positive numbers $A$ and $0 \leq s(\omega) \in L_1(\mu)$ such that

$$
\rho(2h, \omega) \leq s(\omega) + A_p(\omega, \omega) \quad \text{a.e.} \quad \omega \in \Omega.
$$

The proof is the same as the proof of Theorem 8. This theorem is also obtained by Shimogaki.

**Theorem 12.** If an additive functional on $\tilde{L}_\rho$ satisfies (CIII), then there exists a function $K(h, \omega)$ of two variables which satisfies the conditions (1), (2) of Theorem 7, such that

$$
\phi(f) = \int_\Omega K(f(\omega), \omega) d\mu
$$

and for every $n = \pm 1, \pm 2, \ldots$, there exists a positive number $A_n > 0$ and $s(\omega) \in L_1(\mu)$ such that

$$
|K(nh, \omega)| \leq s(\omega) + A_p(h, \omega)
$$

for all $h$ and a.e. $\omega \in \Omega$.

The proof of this theorem is as same as the proof of Theorem 7 and Theorem 8, and so it is omitted.

The continuity condition of additive functionals on $L_\rho (\rho > 0)$ considered by Friedman and Katz is equivalent to the so-called order-continuous condition:
ON ADDITIVE FUNCTIONALS

(CIV) \( f_t(\omega) \to f(\omega) \) \( a.e. \), \( \omega \in \Omega \) and \( \bigcup_{i=1}^{\infty} |f_i| \subseteq L_p \) implies \( \phi(f_t) \to \phi(f) \).

The condition (CIV) implies (CI), (CII) and (CIII).

Let \( \phi \) be an additive functional on \( L_p \) satisfying (CIV). Then the kernel function \( K(h, \omega) \) which is defined in Theorem 7 is continuous with respect to \( h \) for a.e. \( \omega \in \Omega \).
